Transmitter Regulator Sites Transmitter Regulator Sites (TRS) were used to regulate the output power of mobile phone transmitters between different network operators. Telecommunications networks operate on frequencies within the frequency bands allocated by the ITU. The ITU defines frequency bands in many regions of the world, the principal ones are shown in the adjacent diagram. From the ITU frequencies, countries and regions may regulate the use of transmitters of specific classes, e.g. stations of a certain maximum power, or to prevent activity within certain bands. History The use of TRS was introduced in Germany in 1998 and many other European countries soon followed. The deregulation of the German mobile telecommunications market had been introduced in Germany in 1996. This resulted in many operators (which had previously owned the networks) selling the properties and licences for their networks to a single network company. However, the resulting network company didn't own all the necessary properties, so it decided to partner with other operators to ensure coverage across the country. The TRS system was introduced to allow the network company (which owned

the network) to control the output power of the transmitters of different operators on its network. The output power (or power level) of transmitters is the main source of a signal, which is received by the receiver. The receiver processes the input signal to produce an output signal (audio, video, data, or other) for the user. The output power is also the main parameter that restricts a user to a specific service, e.g. voice calls, text messages, or data sessions. The system allowed the operators to regulate this parameter in a way that allowed them to meet their requirements for coverage and capacity. The maximum output power of transmitters of one operator was limited by the network operator to ensure that other operators didn't need to upgrade their networks just to be able to offer the same services as the network operator. Germany In Germany, the two main network companies, Deutsche Telekom and Telefonica Deutschland, were allowed to own up to 50% of any individual licences of transmitters which they rented out.
